PLEASE FILL IN FROM PUMP NAMEPLATE

Pump Model_____

Spec. No._____

Serial No._____

Seal No._____

RETAIN MANUAL FOR REFERENCE

Congratulations

You are now the owner of a Price® Pump Co. Air Operated Diaphragm Pump. This pump was carefully inspected and subjected to final performance tests before being released for shipment. In order to achieve maximum performance and reliability, please follow the simple instructions in this manual.

RECOMMENDED PRECAUTIONS

1. For satisfactory operation and safety, maximum inlet air pressure must not exceed 125 psi (8.79kg/sq cm).
2. No modifications, additions or deletions should be made to the pump without prior approval of the factory.
3. Drain casing completely and flush with water before servicing a pump handling volatile or harmful liquids.

READ CAREFULLY THE CAUTION BELOW

The performance of your Price® Pump Co. Air Operated Diaphragm Pump is based on clean, room temperature, water with suction conditions as shown on the performance curves. If used to pump liquids other than water, pump performance may differ from rated performance based on the different specific gravity, temperature, viscosity, etc. of the liquid being pumped. A standard pump, however, may not be safe for pumping all types of liquids, such as toxic, volatile or chemical liquids, or liquids under extreme temperatures or pressures.

Please consult Price® Pump Co. catalogs as well as local codes and general references to determine the appropriate pump for your particular application. Since it is impossible for us to anticipate every application of a Price® Air Operated Diaphragm pump, if you plan to use the pump for a non-water application, contact Price® Pump Co. beforehand to determine whether such application may be appropriate and safe under the operating conditions. Failure to do so could result in property damage or personal harm.

OPERATING INSTRUCTIONS

INSTALLATION

Bolt pump to a mounting pad using appropriately sized diameter bolts. Rubber vibration insulators should be used between the pump mounting feet and mounting pad to reduce pump vibrations and stresses. In permanent installations the pump should not be directly attached to rigid piping, but instead should be connected through flexible hoses or equivalent on both the suction and discharge. This should be done to reduce pipe stresses and vibrations which are characteristic of the reciprocating nature of the pump. A surge suppressor may be required on the discharge line of the pump if further reduction in vibration or a reduction of pulsation in the discharge flow is desired.

If the pump is used in a submerged application a line or hose should be attached to the pump air exhaust to prevent liquid from entering the air valve when the pump is shutdown or operating at low discharge heads.

CARE MUST BE EXERCISED WHEN SUBMERGING THE PUMP IN CORROSIVE PUMPING MEDIA.

Suction and discharge pipe size should be at least equal to the inlet pipe diameter or larger. Larger, if highly viscous liquid is to be pumped or long lengths of pipe are used. When using suction hoses use the non-collapsing reinforced type, since this pump is capable of producing high vacuum at the suction inlet.

SOLIDS-HANDLING CAPABILITY

Price® Pump Air Operated Diaphragm Pumps will pass the following spherical solid sizes:

Model	Particulate Size
0.5 AOD	1/8" Dia. (3.2mm)
1.0 AOD	1/8" Dia. (3.2mm)
1.5 AOD	3/16" Dia. (4.7mm)
2.0 AOD	3/8" Dia. (9.5mm)
3.0 AOD	7/16" Dia. (11mm)

If the possibility exists that larger sized solids may be suspended or carried along by the pumping media, install a strainer on the suction line with smaller sized

holes than the allowable solid size. This will prevent the larger solids from entering the pump and interfering with operation of the pump ball valves.

AIR SUPPLY

The inlet to the air valve is a female NPT fitting. The air supply line should be sized accordingly so that there is no restriction less than inlet pipe size.

NOTE: Long air lines require larger diameters to minimize air system pressure loss to insure the required air pressure and flow rate at the pump air inlet. It is safe to use up to **125 psig (8.79 kg/sq cm)** for pumping requirements.

WARNING: DO NOT EXCEED 125 PSIG (8.79 KG/SQ CM) AIR SUPPLY PRESSURE AS COMPONENT DAMAGE OR PERSONAL INJURY MAY RESULT.

PUMP CONTROL

The pump operating conditions, flow (GPM) and discharge head (PSIG) can be controlled in the following manner

1. Throttling the pump discharge by means of a valve on the discharge line. When the pump discharge pressure equals the air supply pressure, the pump will stop. This will not harm the pump; however, do not exceed **125 psig (8.79 kg/sq cm)** air supply pressure. The pump may be in this mode indefinitely. By opening the discharge valve the pump will resume pumping.

2. The air pressure supply can be limited to the pump. Price® Pump recommends the installation of a Price® Pump air filter/pressure regulator for all AOD applications. A globe or gate valve can be used before the regulator for on or off control. Failure to use an air pressure regulator will cause the pump air inlet pressure and thus discharge pressure to climb to maximum air system pressure when the pump is stopped.

MINIMUM AIR SUPPLY PRESSURE

This air valve incorporates a stall-free design and will begin operating with air inlet pressures as low as **5 psig (.35 kg/sq cm)**.

OPERATING INSTRUCTIONS

OPERATING INSTRUCTIONS

The pump air valve is of an oilless design; that is, no lubrication is required or recommended. A clean, dry air supply should be provided for optimum air valve operation and life. In cold weather operation, or under conditions of high pump discharge pressure and relatively high humidity, air valve freezing may occur as a result of moisture in the compressed air being released. If this occurs, anti-freeze, of the ethylene glycol type, may be used in a measuring dispenser, such as an air line lubricator at the pump air inlet. The resulting mist will keep the air valve free of ice build-up.

1. In cases where there are several air-operated diaphragm pumps being used simultaneously and freezing of the air valve occurs frequently due to excessive moisture in the compressed air system, it may be advantageous to install a desiccant type compressed air dryer in the air system to purge the air supply of unwanted moisture.

For permanent installations, an air filter and water/ oil separator should be used. This is always good practice, since it insures maximum life of the air valve moving parts and seals by keeping them clean of dirt and oil residue.

Excessive oil and water in the inlet air supply will cause a varnish-like substance to form on the self-lubricated valve spool. This will eventually lead to valve spool "sticking" and result in erratic spool operation. Should this occur, the spool and housing bore may be cleaned with a commercial safety solvent.

2. When starting the pump, make sure all valving on the suction and discharge lines are open. The pump will not prime with the valving closed. Pump cavitation will occur if the suction line is restricted with foreign matter. Use a suction strainer with hole size less than allowable solid size for model in question.

3. When pumping highly viscous materials, it is advisable to check the pump flow rate vs. the pump stroke rate.

PUMP MODEL	AVG. GALS. PER STROKE*	
	Std. Elastomers	Teflon Elastomers
.5 AOD-Non Metallic	.016 (.06L)	.014 (.05L)
1.0 AOD	.18 (.68L)	.15 (.58L)
1.5 AOD	.35 (1.3L)	.20 (.75L)
2.0 AOD	.85 (3.2L)	.80 (3.0L)
3.0 AOD	.87 (3.3L)	.82 (3.1L)

*Actual test data with flooded suction and specific gravity of 1.0.

One pump stroke is equal to one exhaust discharge. The pump should not pump faster than the material is capable of being drawn into the pump inlet. If this occurs, cavitation will occur and could damage to the pump.

4. To determine maximum pumping speed, increase air supply pressure while observing pump discharge increase. When discharge flow no longer increases, throttle back air until pump discharge flow starts to fall off. This point is the optimum pumping speed achievable under those controlled by either one of the two methods previously mentioned under the PUMP CONTROL section of this manual.

5. The pump air exhaust port should be kept free from blockage. The pump should never be operated submerged without installing a line to the exhaust port and directing the same above the liquid surface. An appropriately sized hose with a male NPT connector may be piped up to the exhaust port and directed away. The exhaust line, if required, should be kept as short as possible or pump performance could be affected. If long lengths of exhaust line are necessary, increase the internal diameter of the exhaust line to minimize pressure drop and pump performance loss. If the exhaust sound level becomes too objectionable, use the air muffler provided.

NOTE: Installing an air exhaust muffler on a submerged pump will not prevent the liquid in which the pump is submerged, from entering the air valve.

CAUTION: If a diaphragm failure occurs, the pumping media may be blown out the exhaust port. This could be hazardous if the pumping media is toxic or aggressive. It is advisable to add a line to the exhaust port and direct it safely away when pumping toxic or aggressive media.

6. Drain pump and flush after use when pumping material which can pack, settle out of liquid suspension, or solidify in time. A packed pump can cause damage to the diaphragm clamping plates and pump shaft when started after a period of interrupted use. The pump may be inverted and drained through the discharge port and flushed through the suction port.

OPERATING TEMPERATURE

The pump should not be used to pump liquids above **248°F (120°C). Verify elastomer & case material temperature limits before installation.** For operating temperatures above **248°F (120°C)** consult factory.

TROUBLESHOOTING

TROUBLESHOOTING

1. Pump will run but will not pump.

- a. Check suction line for leaks.
- b. Tighten bolts or clamps on suction manifold of pumps.
- c. Material too viscous to pump at high rate of flow - slow down pump by reducing air supply pressure to pump or use larger diameter suction line.
- d. Suction manifold & pump chambers misaligned - disassemble & realign.
- e. Suction or discharge balls jammed open with foreign object - disassemble pump and remove foreign object.

NOTE: Optimum priming speed for these pumps is obtained when air inlet pressure is maintained between 15-20 psi, (1.0-1.4 kg/cm²) with open pump discharge.

2. Air bubbles in pump discharge line

- a. Check suction line and manifold bolts or clamps for leaks.
- b. Cracked or ruptured diaphragm.

3. Intermittent pump operation and/or ice blowing from exhaust port.

- a. Remove obstruction from suction line.
- b. Valve freeze-up - install de-icing device on air inlet line or suitable air dryer in compressed air line.
- c. Sticky air valve - remove main spool & clean with safety solvent.

4. Pump stops pumping.

- a. Increase air supply pressure but **DO NOT exceed 125 psig (8.79 kg/cm²)** under any circumstances and check for obstruction in suction or discharge line.
- b. Spool sticking - remove main spool & clean with safety solvent - install suitable filter on air inlet if dirt or contaminants persist.
- c. Air valve ice-up - excess moisture on the muffler is an indication that significant water is present in the air supply. Depending on the degree of severity, an in line water separator or air dryer is recommended.

5. Severe pump vibration with intermittent flow.

- a. Ruptured diaphragm - disassemble pump, replace diaphragm and clean air valve if necessary.
- b. Mechanical failure - disassemble pump and inspect for bent shaft, ruptured diaphragm, other part failure.

6. Pumping media leaking from exhaust port.

- a. Ruptured diaphragm - disassemble pump, replace diaphragm - clean air valve if necessary.

7. Varying pump discharge per stroke.

- a. Remove suction manifold and check for obstructions.
- b. Worn or leaky ball valves & seats - disassemble pump and replace worn parts.
- c. Check to verify bolts are fastened tightly and re-torque if necessary.

8. Slowing of pumping action

- a. Clogged air exhaust muffler – clean or replace
- b. Ice buildup in air valve - install de-icing device on air inlet line.

REPAIR AND MAINTENANCE

PUMP DISASSEMBLY INSTRUCTIONS

AOD-XXXX (Bolted Design) ALL ELASTOMERS

Prior to disassembly of any AOD pump follow the “caution” below.

CAUTION; Do not attempt to perform any maintenance or repair on the air operated diaphragm pumps until the compressed air line to the pump and pump discharge line has been shut off, bled down, and disconnected. In addition, when pumps are being used to pump toxic or aggressive media the pumps should be flushed clean prior to disassembly.

1. Pump should be disassembled in the normal upright position. Remove cap screws, flat washers and hex nuts from the discharge (top) manifold. Remove manifold, ball valves, ball seats, and o-rings (Teflon only).

2. Remove cap screws, flat washers and hex nuts from suction manifold. Remove remaining pump chamber assembly from suction manifold & place on table.

Check all ball valves, and ball valve seats for excessive wear or deep gouges. Replace if necessary. Excessively worn parts will adversely affect pump performance.

NOTE: Mark pump chambers and air chambers with an index line 90° across the diaphragm as well as an L and R (left and right) to distinguish the pump chambers. These marks will aid in alignment during reassembly.

3. Remove cap screws, flat washers and hex nuts, from pump chamber which connect pump chamber to clamp ring. Remove pump chambers.

4. Remove cap screw and stainless washer from pump shaft. Disassemble outer diaphragm clamping plate, diaphragm, backup diaphragm (Teflon only), inner diaphragm clamping plate, and bumper. Slide shaft from the air valve housing with opposing diaphragm(s) and plates attached. Check diaphragms & rubber bumpers for wear and replace, if necessary.

5. Remove remaining diaphragm and plates from shaft by putting shaft in vise between two blocks of wood or soft metal jaws and removing the cap screw from outer end of shaft.

6. Remove Teflon tape (Teflon only) from both pump chambers.

7. Refer to Air Valve Disassembly Instructions in this manual.

REPAIR AND MAINTENANCE

PUMP RE-ASSEMBLY INSTRUCTIONS

AOD-XXXX (Bolted Design) ALL ELASTOMERS

1. Place pump shaft in vise with soft metal jaws or wooden blocks between the vise jaws and shafts . Assemble new rubber bumper , inner diaphragm clamping plate, back up diaphragm (Teflon only), new diaphragm, and outer diaphragm clamping plate , with the diaphragm concave side facing upward. Apply Loctite #242 (or equivalent) to cap screw and assemble to shaft with stainless steel flat washer . Torque cap screw to **400 inch lbs. (45 n -m)**.

2. Push shaft through bore in air chamber/air valve assembly. Check for free movement of shafts then bottom out diaphragm in air chamber. Invert assembly and assemble remaining new bumper , inner diaphragm clamping plate , back up diaphragm (Teflon only), new diaphragm, and outer diaphragm clamping plate , with cap screw and flat washer per step #1 above. Torque cap screw to **400 inch lbs. (45 n -m)**.

3. Install new Teflon tape (Teflon only) onto both pump chambers. Place pump chamber marked either L or R on table and align proper index mark on respective air chamber.

NOTE: Diaphragm should be depressed into air chamber being assembled at this time. Place diaphragm outer bead into groove in pump chamber. Check to make sure diaphragm bead fits evenly into groove.

4. Install and tighten the cap screws, washers, and nuts to **130 IN-LB (15 N-M)**. After tightening, check alignment between pump chamber and air chamber. If surfaces are not reasonably parallel, leakage at the ball seats could occur.

5. Push opposing diaphragms into their respective air chamber. The diaphragm bead should sit flush in air chamber groove.

6. Place the other pump chamber onto the exposed diaphragm. Using either the previously made alignment marks, or by visual inspection, align the two pump chambers so their respective manifold flanges are parallel.

7. Repeat step 4 for second pump chamber.

8. Place a suction ball valve, a valve seat and two Teflon o-rings (Teflon only) into the bottom of each pump chamber. Align the pump with the suction manifold and attach with cap screws, washer and hex nuts .

9. Place a discharge ball valve, a valve seat and two Teflon o-rings (Teflon only) into the bottom of each pump chamber. Align the pump with the suction manifold and attach with cap screws, washer and hex nuts.

CAUTION: DO NOT TORQUE MANIFOLD BOLTS BEYOND 130 IN-LB (15 N-M).

REPAIR AND MAINTENANCE

AOD AIR VALVE DISASSEMBLY INSTRUCTIONS

POLYPROPYLENE, PVDF & AOD-XXXX CLAMPED & BOLTED, ALL ELASTOMERS

REMOVAL OF AIR CHAMBERS

1. Remove the five hex nuts, lock washers, special flat washers and flat head socket screws which retain one of the air chambers to the air valve housing. Repeat this step for the opposite air chamber.

2. Loosen the connection between the long flathead screw and short flat head screw at coupling nut by turning both and counter clockwise using two Allen wrenches. Loosen lock-nut from coupling nut, and remove both from long flat head screw.

3. Set aside gaskets and, if used, air chamber clamping rings. Plastic pumps are bolted while metallic pumps can either use clamping rings or be bolted. Remove seals from both air chambers. Replace these items during reassembly.

AIR VALVE BODY DISASSEMBLY INSTRUCTIONS

1. Remove spool housing end caps, gaskets and cap screws from spool housing.

2. Remove main spool and examine spool, piston rings and ring expanders for wear. Replace piston ring set & spool if deeply scratched, chipped or worn. New spools will be interchangeable with old. If main spool bore in spool housing has become corroded, excessively pitted, or deeply scratched replace spool housing.

3. Remove muffler from air valve housing and check inside for dirt and debris. If muffler is clogged it will affect pump performance. Replace if necessary.

4. Remove spool housing and gasket by removing the four socket head cap screws and lock washers. Check gasket for any degradation and replace if required.

5. Inspect 'Oillite' bronze sleeve bushings in valve housing. Replace as necessary.

6. Remove the pilot spool from the air valve by pulling out at one end. Remove the piston ring assemblies from

each end of the pilot spool. Examine for wear and replace as necessary.

7. The air valve assembly is now completely disassembled.

AIR VALVE BODY REASSEMBLY INSTRUCTIONS

CAUTION: Care must be taken at this stage of reassembly to ensure cleanliness. A dirty valve will stick and will not work properly. Keep area free of dirt, oil, and metal chips.

1. Clean all metal parts with good grade safety solvent prior to reassembly.

2. Press shaft bushings into air valve housing, making sure they are properly aligned with the bore in the valve housing. Press bushings in to a height of **0.165"** above the flush position.

3. Install new piston ring assemblies on pilot spool. Push pilot spool with piston rings into bore of air valve. Take care to position splits in piston rings to 3 o'clock or 9 o'clock position in bore.

4. Inspect spool for scratches, scoring, chips, and wear. If severe grooving or marking is evident, replace spool. To ensure maximum performance the spool should not be excessively worn, although the pump will still run satisfactorily.

5. Insert piston ring seals and expander rings prior to reassembly. Replace with new if required.

NOTE: Upon reassembly of piston ring seals and expander rings the opening in the expander ring and the split in the piston ring should be assembled 180° apart. Also, upon reassembling the spool to the spool housing bore, rotate piston ring seals in their grooves until the split in the seal is at the valve housing 3 or 9 o'clock position. This prevents the split from covering valve housing ports during reassembly. This also eliminates the tendency to hang up on a port. Do not install main spool in a centered position or pump may not start.

6. Install spool housing cap gaskets with existing end caps and 1/4" - 20 Allen head screws at both ends of spool housing.

REPAIR AND MAINTENANCE

7. Position new gasket and spool housing assembly onto valve housing and secure with four Allen head screws, and lock washers. Torque screws to **7 ft-lbs. (9.5 n-m)**.

8. Check muffler to make sure that it is clean and free of debris. If it cannot be cleaned, replace with new. Install muffler in air valve housing. Do not over-tighten. One quarter turn past hand tight should be sufficient.

AIR CHAMBER REASSEMBLY TO AIR VALVE BODY

1. Install new seals in both air chambers. Important! The lips of seal must face away from the air valve housing and the lips of seal must face inward towards the center of the air valve housing.

2. Align gasket with air valve housing and attach air chamber using five flathead screws, special flat washers, lock washers and hex nuts.

NOTE: For any model which uses air chamber clamp rings make certain to place the clamp rings in position before attaching air chambers to the air valve body. The beveled edge of the clamp ring should face towards the air chamber.

3. Thread long flat head screw through the appropriate hole in the opposite air chamber and gasket, which lines up with the hole left blank in step 2 when this air chamber was installed. Thread locknut and coupling nut onto long flathead screw. Lock coupling nut in place with locknut.

4. Install second air chamber with gasket and long flathead screw with locknut and coupling nut onto air valve. Attach air chamber to air valve using five flathead screws (9), special flat washers, lock washers and hex nuts.

5. Install short, flat head screw in blank hole in first air chamber, then engage coupling nut. Tighten flat head screws and using two Allen wrenches. Torque all air chamber to air valve hardware to **7 ft-lbs. (9.5 n-m)**.

6. The air valve assembly is now completely refurbished and ready for further pump assembly.

PRICE AOD® PUMP CAUTIONS & WARNINGS

- **CAUTION:** A Static charge buildup could occur in a plastic pump or an electrically insulated metal pump.
- **WARNING:** Any contaminants in the air supply will be exhausted out the muffler to the atmosphere.
- It is recommended that all piping connections to the pump should be flexible.
- **WARNING:** Verify chemical compatibility of the pump materials of construction with the fluid being pumped before use.
- Price AOD® pumps are not designed for use in sanitary or food applications.
- Submerged Price AOD® pumps should have their exhaust piped away from the liquid level. A submerged pump may leak some air from gasketed joints. Do not submerge pumps in corrosive fluids or media.
- A pump which has stopped due to air valve 'icing' will restart by itself when the ice is removed or melts.
- Use only Price Pump original equipment factory replacement parts.
- **CAUTION:** Before start-up, re-torque all external fasteners to the values listed in this I&O manual supplied with the pump.
- Pump fluid temperature limits must be observed:
 - Non-Metallic pumps - 180 - 212 deg. F max. (82 - 100 deg. C) depending on pump material or elastomers.
 - Metallic pumps - 180 - 248 deg. F max. (82 - 120 deg. C) depending on elastomers.
- **CAUTION:** Do not exceed 125 psi (8.8 Bar) air inlet pressure as component damage or personal injury may result.
- Price AOD® pumps must only be operated by clean, oil free, dry compressed air.
- Shut off, bleed down and disconnect the compressed air supply before doing any maintenance or repair to the pump.
- The pump should be flushed before disassembly. The pump should be inverted (outlet at bottom) to drain properly.
- **WARNING:** A diaphragm failure could:
 - Cause the system to which the pump is connected to be pressurized up the compressed air supply line and mix air with the fluid being pumped.
 - Cause the fluid being pumped to be sprayed out through the exhaust muffler.
- **CAUTION:** Aluminum Price AOD® pumps are not suitable for use with 1, 1, 1-trichloroethane, methylene chloride or other materials containing halogenated hydrocarbons. Aluminum wetted parts can react with these solvents and explode. Consult solvent suppliers for compatibility with aluminum pumps before installation.
- **CAUTION:** For 1-1/2", 2" and 3" Price AOD® pumps, unit weight may exceed 65 lbs. (30 kg).

Price AOD® pump sound levels at a distance of 3 ft. (1 meter) with an air inlet pressure of 35 psig.

Pump Size (in Inches)	Pump Material	Sound Pressure Level (RMS db)
1/2"	Non-Metallic	82 db
1"	Non-Metallic	82 db
1"	Metallic	82 db
1-1/2"	Metallic	82 db
2"	Non-Metallic	79 db
2"	Metallic	80 db
3"	Metallic	80 db

Warning and Safety instructions - ATEX

Please observe all Warning and Safety notes

This symbol marks notes which contain safety relevant information. If this information is disregarded or the pump is operated not in accordance with the appropriate instructions, potentially dangerous situations may result which may cause harm to humans, production plants and machines.

This symbol marks notes and instructions relevant to installing and operating **E_x** approved pumps in explosion hazardous areas.

Pumps for use in hazardous areas

Pumps for use in explosion hazardous areas are marked accordingly showing the approved zone and group. If the pump is marked as shown below it can be used in hazardous areas, Zone 1 according to the current ATEX regulations. The special conditions for this operation must be strictly adhered to as outlined in the ATEX manual.

 **II 2 G c II T4**
LU 03 ATEX M003X

The pump must be connected to earth. The wire used for this must have a cross section of not less than **4 mm²**.

The wire used to earth the pump must be connected to the Air Valve of the pump (as shown in the drawing below), and then to the earth. Prior to any installation work on the pump the earthing wire has to be connected. If the pump is being removed the earthing wire must be removed last.

Any maintenance work on the pump should only be carried out by trained maintenance personnel.

If the pump is modified in any way, without the approval of the manufacturer, the pump may not be installed or used in hazardous areas.

GENERAL TERMS OF SALES FOR PRODUCTS

1. GENERAL

A. Seller's price is based on these sales terms and conditions. The agreement and inclusion of other or amended terms in this contract will result in a change (including increase) in Seller's price (as may be contained in any price books or quotations) to reflect such other or amended terms. This contract shall represent a complete and exclusive statement of the agreement between the parties and may not be modified, supplemented, explained or waived by parole evidence, any Terms and Conditions contained in Buyer's purchase order or request for quotation, any course of dealings between the parties, Seller's performance or delivery, or in any other way. The Terms and Conditions of this contract may only be modified or waived in a written document signed by an Officer of Seller. These terms are intended to cover all activity of Seller and Buyer hereunder, including sales and use of products, parts and work and all related matters (references to products include parts and references to work include construction, installation and start-up). Any reference by Seller to Buyer's specifications and similar requirements are only to describe the products and work covered hereby and no warranties or other terms therein shall have any force of effect. Any information provided by Seller including, but not limited to, suggestions as to specific equipment does not imply any guarantee of specific suitability and/or material compatibility in a particular application, since many factors outside the control of Seller may affect the suitability of products in a particular application. Catalogs, circulars, similar pamphlets and information contained on websites of the Seller are issued for general information purposes only and shall not be deemed to modify the provisions hereof.

B. The agreement formed hereby and the language herein shall be construed and enforced under the Uniform Commercial Code as in effect in the State of California on the date hereof.

2. TAXES

Any sales, use or other similar type taxes imposed on this sale or on this transaction and/or any import or export duties or fees as may be assessed or imposed on or as a result of deliveries under this transaction are not included in the price. Such taxes shall be billed separately to the Buyer. Seller will accept a valid exemption certificate from the Buyer if applicable; however, if an exemption certificate previously accepted is not recognized by the governmental taxing authority involved and the Seller is required to pay the tax covered by such exemption certificate. Buyer agrees to promptly reimburse Seller for the taxes paid.

3. PERFORMANCE, INSPECTION AND ACCEPTANCE

A. Unless Seller specifically assumes installation, construction or start-up responsibility, all products shall be finally inspected and accepted within thirty (30) days after arrival at point of delivery. Where seller has responsibility for installation, construction or start-up all work shall be finally inspected and accepted within thirty (30) days after completion of the applicable work by Seller. All claims whatsoever by Buyer, (including claims for shortages) except only those provided for under the WARRANTY AND LIMITATION OF LIABILITY AND PATENTS Clauses, hereof, must be asserted in writing by Buyer within said thirty (30) day period or they are waived. If this contract involves partial performance, all such claims must be asserted within said thirty (30) day period for each partial performance. There shall be no revocation of acceptance. Rejection may be only for defects substantially impairing the value of products or work and Buyer's remedy for lesser defects shall be those provided for under the WARRANTY AND LIMITATION OF LIABILITY Clause.

B. Seller shall not be responsible for non-performance or for delays in performance occasioned by any causes beyond Seller's reasonable control, including, by way of example and not limitation, to labor difficulties, delays of vendors or carriers, fires, governmental actions, or shortages of material, components, labor, or manufacturing facilities. Any delays so occasioned shall affect a corresponding extension of Seller's performance dates, which are, in any event, understood to be approximate. IN NO EVENT SHALL BUYER BE ENTITLED TO INCIDENTAL OR CONSEQUENTIAL DAMAGES FOR LATE PERFORMANCE OR FOR A FAILURE TO PERFORM. Seller reserves the right to make partial shipments and to ship products, parts or work which may be completed prior to the scheduled performance date.

C. In the event that Seller has agreed to mount motors, turbines, gears, or other products which are not manufactured by Seller and which are not an integral part of Seller's manufactured product, and a delay in the delivery of such products to Seller occurs that will cause a delay in Seller's performance date, Seller reserves the right to ship its product upon completion of manufacture and to refund an equitable portion of the amount originally included in the purchase price for mounting without incurring liability for non-performance.

D. Seller reserves to itself the right to change its specifications, drawings and standards if such changes will not impair the performance of its products, and parts, and further those products, and parts, will meet any of Buyer's specifications and other specific product requirements which are a part of this agreement. Seller is a global supplier of products and utilizes parts and products obtained worldwide, and Seller's products supplied under this contract shall be subject to Seller's sole determination as to all manufacturing, sourcing, assembly and supply unless otherwise specifically agreed in writing.

E. The manufacture and inspection of products and parts shall be to Seller's Engineering and Quality Assurance standards, plus such other inspections or tests of documentation as are specifically agreed to by Seller. Requirements for any additional inspection, tests, documentation, or Buyer witness of manufacture, test, and/or inspection shall be subject to additional charges.

4. TITLE AND RISK OF LOSS

Title and risk of loss shall pass to buyer upon delivery of products at the designated "Ex Works" as defined by Incoterms, unless otherwise agreed by the parties.

5. EROSION AND CORROSION

It is specifically understood that products and parts sold hereunder are not warranted for operation with erosive or corrosive fluids or for operation with any fluid or under any operating condition in variance with the specifications of this contract. No product or part shall be deemed to be defective by reason of failure to resist erosive or corrosive action of any fluid and Buyer shall have no claim whatsoever against Seller therefore. No product shall be deemed defective by reason of any effect on Seller's products of the action or results (such as vibration) of any goods or system (such as piping) not supplied by Seller.

6. BUYER'S RESPONSIBILITY

The design specifications of the equipment require the operation of the equipment within certain parameters and may call for the use of speed controls, safety devices, set points or other control devices to insure that the operation remains within design parameters. Buyer agrees and understands that the equipment must be operated and maintained within design specifications and operated within the specifications of the contract, irrespective of whether controls or devices are otherwise required.

7. WARRANTY AND LIMITATION OF LIABILITY.

A. Seller warrants only that its product and parts, when shipped, will be free from defects in materials and workmanship. All claims for defective products or parts under this warranty must be made in writing immediately upon discovery and, in any event, within two (2) years of shipment by seller and all claims for defective work must be made in writing immediately upon discovery. Defective items must be held for Seller's inspection and returned to the sellers' point of original shipment upon request.

ANY UNAUTHORIZED DISASSEMBLY, ALTERATION OF OR TAMPERING WITH ANY PRODUCT OR COMPONENT MAY "VOID" THE WARRANTY, IN THAT SUCH ACTION WILL RESULT IN SELLER BEING RELEASED AND RELIEVED FROM ITS OBLIGATIONS UNDER THIS WARRANTY AND FOR ANY FURTHER COSTS OR ACTIONS UNDER CLAUSE 7.C. FOLLOWING, AND THE BUYER ASSUMING SOLE RESPONSIBILITY FOR THE COSTS AND RESULTS OF SUCH ACTION. THE FOREGOING IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES WHATSOEVER, EXPRESS, IMPLIED AND STATUTORY, INCLUDING WITHOUT LIMITATION, THE IMPLIED, WARRANTIES OF MERCHANTABILITY AND FITNESS.

B. ANY PRODUCT (S) SOLD HEREUNDER WHICH ARE NOT MANUFACTURED BY SELLER ARE NOT WARRANTED BY SELLER and shall be covered only by the express warranty, if any, of the manufacturer thereof. With respect to products and parts not manufactured by Seller, Seller's only obligation shall be to assign to Buyer, to the extent possible, whatever warranty Seller obtains from the manufacturer.

C. Upon Buyer's submission of a claim as provided above and its substantiation, Seller shall at its option either (i) repair or replace its product, part or work at the original place of shipment, or (ii) refund an equitable portion of the purchase price.

D. THE FOREGOING IS SELLER'S ONLY OBLIGATION AND BUYER'S EXCLUSIVE REMEDY FOR BREACH OF WARRANTY AND, EXCEPT FOR THE REMEDIES PERMITTED UNDER THE PERFORMANCE, INSPECTION AND ACCEPTANCE AND THE PATENTS CLAUSES HEREOF, THE FOREGOING IS BUYER EXCLUSIVE REMEDY AGAINST SELLER FOR ALL CLAIMS ARISING HEREUNDER OR RELATING HERETO WHETHER SUCH CLAIMS ARE BASED ON BREACH OF CONTRACT, TORT (INCLUDING NEGLIGENCE OR STRICT LIABILITY), INDEMNITY OR OTHER THEORIES. BUYER'S FAILURE TO SUBMIT A CLAIM AS PROVIDED ABOVE SHALL SPECIFICALLY WAIVE ALL CLAIMS FOR DAMAGES OR OTHER RELIEF, INCLUDING BUT NOT LIMITED TO CLAIMS BASED ON LATENT DEFECTS. IN NO EVENT SHALL BUYER BE ENTITLED TO INDIRECT, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES, NOR FOR DAMAGES FOR LOSS OF USE, LOST PROFITS OR REVENUE, INTEREST, LOST GOODWILL, WORK OR PRODUCTION STOPPAGE, IMPAIRMENT OF OTHER GOODS, INCREASED EXPENSES OF OPERATION, OR THE COST OF PURCHASING REPLACEMENT POWER OR OTHER SERVICES BECAUSE OF SERVICE INTERRUPTIONS. FURTHERMORE, IN NO EVENT SHALL SELLER'S TOTAL LIABILITY FOR DAMAGES OF BUYER EXCEED THE PURCHASE PRICE OF THE PRODUCTS OR PARTS MANUFACTURED BY SELLER AND UPON WHICH SUCH LIABILITY IS BASED. ANY ACTION ARISING HEREUNDER RELATED HERETO, WHETHER BASED ON BREACH OF CONTRACT, TORT (INCLUDING NEGLIGENCE) OR OTHER THEORIES, MUST BE COMMENCED WITHIN ONE (1) YEAR AFTER THE CAUSE OF ACTION ACCRUES OR IT SHALL BE BARRED.

8. PURCHASER'S REPRESENTATIONS & WARRANTIES

Purchaser represents and warrants that the products(s) covered by this contract shall not be used in or in connection with a nuclear facility or application. The parties agree that this representation and warranty is material and is being relied on by seller. This provision may be modified in a separate writing signed by an officer of Price Pump Co.

9. PATENTS

Seller agrees to assume the defense of any suit for infringement of any patents brought against Buyer to the extent of such suit charges infringement of an apparatus or product claim by Seller's product in and of itself, provided (i) said product is built entirely to Seller's design, (ii) Buyer notifies Seller in writing of the filing of such suit within ten (10) days after the service of process thereof, and (iii) Seller is given complete control of the defense of such suit, including the right to defend, settle and make changes in the product for the purpose of avoiding infringement of any process or method claims. Provided however, Seller will not defend any suit for infringement of a claimed patent where such alleged infringement is the result of following specific instruction furnished by Seller.

10. EXTENT OF SUPPLY

Only products as listed in Seller's proposal are included in this agreement. It must not be assumed that Seller has included anything beyond same.

11. MANUFACTURING SOURCES

To maintain delivery schedules, Seller reserves the right to have all or any part of the Buyer's order manufactured at any of Sellers', sellers' licensees or sub contractors' plants, globally.

12. TERMS OF PAYMENT

Net 30 days from date of invoice.

13. ARBITRATION

In the event a dispute arises between the parties relating to or arising out of this agreement, the parties agree to attempt to have their senior management amicably settle the matter. In the event that the matter cannot be settled, the parties shall submit all disputes relating to this Agreement (whether contract, tort, products liability or otherwise) to binding Arbitration before a panel of arbitrators under the Commercial Dispute Resolution Procedures of the American Arbitration Association. Each party shall appoint an arbitrator and the third shall be selected in accordance with the rules of the American Arbitration Association. Judgment upon the award may be entered in any court having jurisdiction. The parties shall cooperate in providing reasonable disclosure of relevant documents. Each party shall bear its own expenses, and the costs and fees of the arbitration shall be borne as allocated by the Arbitrator.

Effective June 2007
